

6-Factor Worksheet does not match scoring assistant results

Frequently Asked Question:

The 6-Factor Worksheet does not match scoring assistant results

Resolution:

The six factor worksheet provides demographically adjusted norms based on a subset of measures from the WAIS-III and WMS-III. Tulsy & Price (2003) provide details regarding the rationale for the development of the 6-factor model. The 6-factor model uses a different configuration of subtests and draws from different normative tables subsequently differences may be observed in index scores derived using the 6-factor calculator compared to the scoring assistant. These differences occur because the polynomial equations used to derive the scores are different and are not a problem with the software.

Tulsy, D.S. & Price, L.R. (2003). The joint WAIS-III and WMS-III factor structure: development and cross-validation of a six-factor model of cognitive functioning. *Psychological Assessment*, 15, 149-162.
