Number correct by serial position

Serial position is a series of subjects are given to recall in a specific order. Then the serial position would denote how many times a specific item on the list was correctly recalled. However CVLT-II cannot generate a report based on percentages of correct answers by serial position. If you need reporting on this specific measurement, it is suggested that you manually compile the serial positions from the response report. It details the specific responses from their trials. The Psychological Corporation Technical Support Center cannot provide support on obtaining this information from the software.
